FOREWORD

The Pond Dynamics/Aquaculture Collaborative Research Support Program (PD/A CRSP) represents an international community of researchers and institutions dedicated to strengthening health and nutrition in developing countries by improving the efficiency of pond aquaculture systems. It is one of several agricultural CRSPs supported by the U.S. Agency for International Development under the authority of Title XII of the International Development and Food Assistance Act of 1975.

The "Global Experiment" in Pond Dynamics/Aquaculture is the major CRSP research activity, covering the period from 1982 to 1987. The Global Experiment was designed to quantitatively describe the physical, chemical and biological principles of pond culture systems. The information gained from the Global Experiment will be used to improve production technologies and develop quantitative production functions to facilitate rigorous economic analyses of aquaculture systems.

Standardization is a key element of the Global Experiment. Standardization permits the comparison of data from diverse geographic locations. The experimental design involves monitoring specified environmental and fish production variables in accordance with standardized work plans in twelve or more ponds at each of seven geographical locations. The variables observed, frequency of observation, and materials and methods are uniform for all locations. The field data are filed in a centralized data base, called the CRSP Central Data Base. Statistical methods will be used to test hypotheses about correlations between variables and to evaluate the sources of variance within ponds, between ponds within locations, and between locations.

The CRSP Central Data Base will be used to develop predictive models of the processes occurring in pond culture systems. The models will be used to provide guidance for ongoing and future research, to predict the performance of existing and proposed pond systems subject to specific inputs and constraints, and to improve the operation and efficiency of pond culture systems.

The Global Experiment includes three cycles of experiments. Each cycle consists of two series of observations, one during the dry season and one during the wet season. The objective of the first cycle is to create a detailed baseline of chemical, physical, and biological data on all ponds treated with a standard level of inorganic fertilizer. In the second experimental cycle, ponds treated with inorganic fertilizer are compared to ponds treated with organic fertilizer. In the third cycle, the responses of ponds to different levels of organic fertilizer are compared.

The goal of the Pond Dynamics/Aquaculture Collaborative Research Data Reports (referred to as Data Reports) is to record the CRSP Central Data Base and to present interpretations of site specific results. The Pond Dynamics/Aquaculture CRSP has conducted the Global Experiment at seven project sites in six developing countries: Thailand, Indonesia, the Philippines, Panama, Honduras, and Rwanda. The first volume of these reports provides descriptive information for each CRSP site. It presents the physical characteristics of each site, including a geographical sketch, climatology, and water and soil analyses. Experimental cycles are described in CRSP Work Plans One to Three, which are summarized in the first volume.

Volume One will serve as the reference volume for the entire report series. Subsequent volumes will focus on each site separately. Each Data Report will include one cycle (wet and dry seasons) of the Pond Dynamics/Aquaculture CRSP Global Experiment. Therefore, with few exceptions, each project site will have three Data Reports devoted to it, representing the results of the three cycles of the Global Experiment. In addition to the hard copy of experimental data published as a part of each Data Report, data are also available from the PD/A CRSP in electronic form (on diskette) for computer analysis. Cycle I of the Global Experiment in Aguadulce, Panama is presented in this volume.

INTRODUCTION

The results of the Cycle I Pond Dynamics/Aquaculture (PD/A) CRSP rainy and dry season experiments, conducted at the Ingeniero Enrique Enseñat Brackishwater Experiment Station (BES), Aguadulce, Panama, are reported in this document. The BES is located about 5 km south of the town of Aguadulce, 0.5 km north of the Port of Aguadulce, and 190 km from Panama City. The BES is located within a zone of approximately 1500 ha of commercial brackishwater shrimp farms located adjacent to the Gulf of Parita on the Pacific Coast. The BES is part of the seed production and research station network of the Dirección Nacional de Acuicultura (DINAAC). Facilities at the station have been described by Egna et al. (1987).

The principal objective of the Cycle I studies was to describe baseline chemical, physical, biological, and hydrological characteristics in experimental ponds stocked with Pacific marine penaeid shrimp (*Penaeus* species) during the rainy and dry seasons.

MATERIALS AND METHODS

Thirteen earthen ponds (555 to 683 m²) at the BES were used in the Cycle I baseline experiments. The rainy season (RS) experiment began on 26 July 1983 and ended on 13 December 1983. The dry season (DS) experiment was conducted from 6 February 1984 through 18 May 1984. Chicken litter (air-dried chicken manure and rice hull litter), obtained from a local commercial layer operation, was applied evenly over each pond bottom at 1000 kg/ha 14 days before stocking shrimp. After the manure application, ponds were filled to a depth of 10 cm and left for 10 days to permit development of a benthic algal mat. Water depth was then increased to 80 cm and four days later ponds were stocked with shrimp. No nutrients other than the initial manure application were added to ponds. Water in all ponds was exchanged daily at a rate equivalent to 5 to 10% of the pond volume.

Commercial hatchery-reared, post-larval (PL) penaeid shrimp with a mean weight of 0.01 g/PL were stocked into ponds during each season. The rainy season stocking rate was 7 PLs/m², and composed of 75% *Penaeus vannamei* and 25% *Penaeus stylirostris*. Because of an almost complete mortality of *P. stylirostris* in all ponds during the RS, dry season experiment ponds were stocked only with *P. vannamei* at 5.25 PLs/m². One pond in the dry season experiment was not stocked with shrimp. Ponds were managed according to guidelines given in the CRSP First Work Plan (undated).

Pond mud samples were collected using the methodology given in the CRSP First Work Plan. Initial RS samples were analyzed in the United States. The final RS samples, which also served as the initial DS samples, and the final DS samples were analyzed at a soils laboratory in Panama. Initial and final water samples were collected from each pond, preserved according to the CRSP First Work Plan, and analyzed for major and minor elements in the U.S.

Water quality samples were collected monthly and analyzed according to the CRSP First Work Plan. Exceptions to the stated methods are detailed below:

- 1) Solar radiation
Daily light intensity (g-cal/cm²-d) was measured with a battery-powered Belfort mechanical pyranograph.
- 2.) Wind speed and direction
Not measured because of lack of equipment.
- 3.) Evaporation
During the RS a provisional evaporation tank, consisting of a 32-cm diameter, 50-cm deep, 20-l metal water cooler insulated with polyurethane and buried 3/4 below ground level, was used to measure evaporation (cm).

- During the DS, evaporation was estimated using a standard weather station evaporation pan equipped with a still-well and hook gauge. Measurements of loss or gain of water were made once daily (at 0800 hours) in the RS, and twice daily (at 0700 and 1800 hours) in the DS.
- 4.) Salinity
Salinity (‰) was measured daily in each pond between 0530 and 0630 hours; measurements were made with an optical refractometer 25 cm below the surface at the deep end.
 - 5.) pH
pH was measured daily in each pond between 0530 and 0630 hours; readings were taken 25 cm below the surface next to the drain pipe at the deep end.
 - 6.) Water chemical analyses
Filterable orthophosphate (ascorbic acid method), nitrite (diazotization method), nitrate (cadmium reduction method), silicate (molybdosilicate method), and total alkalinity were analyzed according to the methodology of Strickland and Parsons (1972). Ammonia (salicylate-hypochlorite method) was analyzed according to the methodology of Bower and Holm-Hansen (1980).
 - 7.) Chlorophyll a, b, and c
These were analyzed according to the methodology of Strickland and Parsons (1972).
 - 8.) Secchi disk
Measured twice a week.
 - 9.) Primary productivity
Primary productivity was determined monthly in both seasons at 2-h intervals using the modified diel curve method, as described by Welch (1968). DO readings were made at 25 cm below the surface.
 - 10.) Zooplankton
During the DS experiment a horizontal tow along the longitudinal axis of each pond was made monthly using an 80-micron mesh Wisconsin plankton net. Wet samples were analyzed to quantify major taxa, and a subsample was dried to determine zooplankton standing crop.
 - 11.) Shrimp growth
Shrimp from each pond were sampled every 15 d. A short beach seine (5 m long x 1 m deep, 2.0-mm mesh) was used for the first two periods. Beginning on day 45 a cast net (2.6 m in diameter, 6.4-mm mesh, 3.6-kg lead line) was used.
 - 12.) Shrimp feeding habits
Ten shrimp were randomly sampled from each pond on three dates during the RS, individually weighed and measured, and the stomach contents individually preserved in 5% glycerin-buffered formalin. The degree of stomach fullness and percent occurrence of food organism taxa were determined for each shrimp size-class.

RESULTS AND DISCUSSION

Meteorology

Rainfall, evaporation, solar radiation, and air temperature data for both seasons are shown in Table 2. The DS was noted to have higher solar radiation, evaporation, and air temperature values. Rain fell on only two occasions during the DS, for a total of 0.23 mm.

Water Quality

Results of water quality analyses are summarized by pond in Table 3. Seasonal water quality means are compared in Table 4. The number of days of low early morning dissolved oxygen during the rainy season greatly exceeded the number during the dry season (Table 5).

Soil Analyses

Results of the pond mud analyses are presented by pond in Table 6; initial and final rainy season analyses are compared in Table 7.

Minor Elements in Water

Results of the initial and final analyses for the rainy and dry seasons are presented in Tables 8 and 10, respectively. Initial and final rainy season samples are compared in Table 9.

Biological Variables

Phytoplankton. Mean pond chlorophyll *a*, *b*, *c*, and *a + b + c* values during the RS ranged from 97.6 to 151.2, 13.3 to 60.8, 33.0 to 75.5, and 185.0 to 277.8 mg/m³, respectively (Table 3). Mean pond values were significantly lower in the DS than in the RS (Table 4). During the RS chlorophyll concentrations in the water supply reservoir tended to be near or below the lowest values for the RS ponds, while in the DS reservoir values were near the highest for the DS pond values.

Mean Secchi disk readings were significantly higher in the RS than in the DS (Tables 3 and 4).

Primary Productivity. Primary productivity values (mg DO/l/d) for diel oxygen curve measurements are found in Table 11, and for light-dark bottle measurements in Table 13. Mean gross and net primary productivity, and mean community respiration were significantly higher during the RS (Table 12). Measurements of primary productivity by the light-dark bottle method were considerably lower than values from diel oxygen curve measurements during the DS.

Zooplankton. Densities and standing crops of zooplankton decreased as salinities increased. Between-pond mean densities were lowest in February (0.57×10^6 organisms/m³) and increased to a high (0.20×10^6 /m³) in May. Mean standing crops were also lowest in February (191.5 mg dry matter/m³), and increased to a high (87.3 mg/m³) in April (Table 14). Variance between ponds in both zooplankton density and standing crop was high, ranging from 50.0 to 64.1% CV for density, and 38.2 to 111.4% CV for standing crop. Juvenile copepods dominated in all DS months, with an overall minimum of 64.3% in February, an overall maximum of 84.6% in May, and a grand mean of 72.9% (Table 15). The density of adult copepods, *Oncea* and *Ergasulus*, (the second and third most dense taxa), decreased as salinities increased, while the density of calanoids (the fourth most dense taxon), increased as salinities increased, then decreased in the last month when salinities were highest. The tintinnid ciliates were present only in February, in six of the twelve ponds. Rotifers were totally absent or low in density in the first three months; densities were highest in May, when salinity was highest.

Shrimp Yield

Shrimp growth, survival, and yield were higher in the DS than the RS (Tables 16 and 17). The mean between-pond harvest weight for *P. vannamei* harvested at the end of the RS was 5.9 g, which represented a gain of 0.29 g/wk. The mean harvest weight for *P. stylirostris* was 20.1 g, which represented a gain of 1.00 g/wk. At the end of the DS, the mean weight for *P. vannamei* was 5.9 g, which represented a gain of 0.37 g/wk.

Mean survival in the RS was 62.8% for *P. vannamei* and only 1.1% for *P. stylirostris*. Inquiry with the post-larvae supplier revealed that the entire lot of *P. stylirostris* was considered substandard in quality. *P. vannamei* post-larvae stocked in the RS were also considered suspect in quality because of the relatively high occurrence of

deformed rostra (22.8%) at harvest. In the DS, when only *P. vannamei* were stocked, the mean between-pond survival was 75.2%. No deformed rostra were found at harvest.

Mean shrimp yield during the RS was 173.2 kg/ha, and daily yield ranged from 1.06 to 1.35 kg/ha/d over the 140-day period. During the DS mean shrimp yield was 228.2 kg/ha, and daily yield ranged from 1.38 to 2.48 kg/ha/d over the 102-day period. Sampling data show that carrying capacity was reached for most ponds in the RS in approximately 60 days, when the mean standing crop for all ponds was estimated to be 161.3 kg/ha. In the DS the carrying capacity appeared to be reached on about day 92 when the mean standing crop for all ponds was 176.8 kg/ha.

Shrimp feeding habits. The following observations about *P. vannamei* feeding habits were made during the study:

1. Small shrimp (during the first, two months of the experiment) had the highest occurrence of empty stomachs. Of the five stomach-fullness categories (0, 25, 50, 75 and 100% full), 25% full occurred more often (42.2%) than any other category (Table 18).
2. The most frequently occurring food groups found in shrimp stomachs were (in descending order of importance): Ciliates (*Tintinnidae*); Cyanophyta (*Oscillatoria*); Chrysophyta (*Amphora*, *Navicula*, *Pleurosigma*, *Pinnularis*); Cnidaria (*Abietinaria*); Copepoda (larvae); and Cladocera (body segments) (Table 19).
3. Detritus constituted 26.9% of the stomach contents (Table 19).

CONCLUSIONS

The RS was characterized by higher rainfall, and pond water temperatures, higher ammonia, nitrite, and chlorophyll concentrations, and greater gross and net primary productivity and community respiration than the DS. The DS was characterized by higher evaporation, air temperature, and solar radiation, higher pond water alkalinity, nitrate, pH, and early morning dissolved oxygen levels, greater Secchi disk visibility, and higher orthophosphate, silicate, and salinity levels, as well as higher shrimp growth rate, survival, yield, and daily rate of production than were observed in the RS.

Zooplankton frequency and standing crop decreased as salinities increased. Adult copepods dominated throughout the DS.

The greatest shrimp production in ponds receiving a pre-stocking application of 1000 kg/ha of chicken litter and daily water exchange rate of 5-10% was 189.6 kg/ha (1.33 kg/ha/d) in the RS and 273.2 kg/ha (2.48 kg/ha/d) in the DS. Mean shrimp production was 173.2 kg/ha (1.23 kg/ha/d) in the RS and 228.2 kg/ha (2.07 kg/ha/d) in the DS. Carrying capacity was reached on about day 60 in the RS (mean standing crop of 161 kg/ha), and on about day 92 in the DS (mean standing crop of 177 kg/ha).

P. vannamei was observed to be omnivorous, with a fairly high intake of detritus. The high occurrence of nearly-empty stomachs throughout the day indicated that natural food organisms were limited for the shrimp standing crops reached in this study.

ACKNOWLEDGEMENTS

We acknowledge the participation of DINAAC technicians Ameth de Leon, Graciela de Gomez, Victoria Batista, Ismael Wong, Arnulfo Franco, Juan Rodriguez, and the University of Panama students Marcos Villareal, Ernesto Lasso de la Vega, Hipolito Chovez, Italo Quesada, Hamed Tuñon, Dalys Lore and Ricardo Visueti, for their dedicated collaboration during the studies.

Units of Measurement and Abbreviations Used in the Appendix Tables

Daily Weather Measurements:

SOLAR1 (solar radiation)	E/m ² /d
SOLAR2 (solar radiation)	cal/cm ² /d
RAIN (rainfall)	cm/d
WIND (wind speed)	km/hr
ATEMPMAX (max air temperature)	°C
ATEMPMIN (min air temperature)	°C
EVAP (evaporation)	mm/d

Daily Pond Measurements:

DEPTH	m
INFLOW	m ³ /hr
OVERFLOW	Y/N
"nil"	<i>Oreochromis niloticus</i>
SALINITY	ppt

Weekly and Twice-Weekly Measurements:

All DO (dissolved oxygen)	mg/L
All TEMP (temperature)	°C
ALKA (alkalinity)	mg/L (as CaCO ₃)
HARD (total hardness)	mg/L (as CaCO ₃)
All N (Kjeldahl, NO ₂ , NO ₃ , Total)	mg/L
All P (Total, Ortho-PO ₄)	mg/L
SECCHI DISK	cm
CHLOROPHYLL a, b, or c	mg/m ³

Diurnal Measurements:

All DO (dissolved oxygen)	mg/L
All TEMP (temperature)	°C

Fish/Shrimp Stocking, Sampling, and Harvesting:

"STK"	stocking
"SAM"	sampling
"HAR"	harvesting
"nil"	<i>Oreochromis niloticus</i>
"VAN"	<i>Penaeus vannamei</i>
"STY"	<i>Penaeus stylirostris</i>
POP. WEIGHT	kg
SAMPLE LENGTH	cm
REPROD. WEIGHT	kg

Plankton and Benthos:

NET (PRIMARY) PRODUCTION	mg C/m ³ /d
GROSS (PRIMARY) PRODUCTION	mg C/m ³ /d

Water Quality Characteristics:

ALKALIN (alkalinity).....	mg/L (as CaCO ₃)
HARDNESS	mg/L (as CaCO ₃)
All N (NH ₃ , NO ₂ , NO ₃ , NO ₂ +NO ₃)	mg/L
All P (Total, Ortho-P)	mg/L
Cl	mg/L
SALT	ppt
SO ₄	mg/L
BORON	mg/L
CALCIUM.....	mg/L
COPPER.....	mg/L
IRON.....	mg/L
MAGNESIUM	mg/L
POTASSIUM.....	mg/L
SODIUM.....	mg/L
ZINC.....	mg/L

Pond Soil Characteristics:

CLAY	%
SILT	%
SAND	%
ORGANIC MATTER	%
SOIL-P.....	ppm
SOIL Ca	meq/100g
SOIL Mg.....	meq/100g
SOIL K	ppm
SOIL Na.....	meq/100g
SOIL N	%
SOIL NH ₄	ppm
SOIL NO ₃	ppm
SOIL CEC.....	meq/100g
SOIL SALT	mmhos/cm
SOIL Al.....	ppm
SOIL Fe.....	ppm
SOIL Zn.....	ppm
SOIL Mn.....	ppm
SOIL Cu	ppm
SOIL SO ₄	ppm

Pond Morphometrics

AREA	m ²
VOLUME	m ³

Analysis of Nutrients and Lime:

All NUTRIENTS	% (dry matter basis)
---------------------	----------------------

Nutrient and Lime Inputs:

All QUANTITIES.....	kg/ha
TSP	"triple superphosphate"
"cac"	CaCO ₃

Table 1. Daily Weather Measurements. Aguadulce, Panama, Cycle I, Wet Season.
